Wireless Telephone System Designed for SOHO Market

A simple wireless telephone system designed to meet the needs of the growing number of small businesses has been released by Wavelink communications. The new EuroPhone XL from Hagenuk enables users to combine the mobility of a digital wireless telephone system with the power of Telstra's ISDN network to achieve the perfect small office system.

The new system is targeted at users who:

- Run a small office
- Need to be able to make and take calls from anywhere in their office; not just at their desk
- Require the flexibility to relocate work areas without major re-cabling of telephone lines
- Currently use mobile phones around the office
- Plan to be moving offices in the future and would like to take the phone system with them
- Need access to services such as the Internet, caller-ID and ISDN

The EuroPhone XL is an ISDN executive telephone with integrated DECT telephone system supporting up to 6 cordless extensions. With one simple connection to Telstra's OnRamp® 2 ISDN service, users get 2 lines with up to 6 different telephone numbers. Users also get access to ISDN features such as direct indial (via Multiple Subscriber Number), caller ID, high speed (up to 128 Kbps) Internet access and the potential to save on local telephone calls.

Apart from unlocking the power of ISDN, the EuroPhone XL wireless system also provides multiple benefits, including:

Flexibility

Moving telephone extensions or the entire office can be accomplished as often as required without any telephone cabling. Via the easy use menu system on the central console, system programming and operation is achieved effortlessly. The system offers fully featured cordless desk telephones (with built in speakerphone, LCD display and caller ID capability) that require no telephone cabling.

Cost Control

As telephone cabling for extensions is not required, hundreds or thousands of dollars in expensive and unsightly wiring can be saved. Time and money is also saved when moving extensions around the office or to relocate the entire office. The costs of having to make return calls when away from the desk are reduced and mobile phone calls around the office can be slashed. Internal calls between office cordless handsets are free.

Increased Mobility / Improved Customer Service

Customers and internal callers alike are able to access the person they are calling, improving customer service. Since staff are no longer tied to their desk telephones, they are able to perform multiple roles, increasing productivity.

Proven, Reliable Technology

DECT (Digital Enhanced Cordless Telecommunications) is recognised as the leading technology in the world for wireless telephone systems. Over 25 million DECT products have already been sold worldwide and in excess of 100 countries have already allocated frequency spectrum for DECT.

Key Features of the Hagenuk EuroPhone XL:

- The EuroPhone XL supports one OnRamp® 2 ISDN service (2 telephone lines with up to 8 different numbers) and up to 6 cordless devices.
- Cordless devices can be any combination of DECT cordless telephones, cordless executive desk telephones and a single cordless terminal adaptor.
- Connect analogue devices such as fax machines via a cordless terminal adaptor.
- The cordless handset has a large LCD display for ease of use and offers up to 70 hours standby battery life.
- Cordless extensions will operate in a radius of 50-300 m from the EuroPhone XL, depending on the operating environment.
- DECT digital technology ensures excellent voice quality and is totally secure to eliminate eavesdropping.
- A digital answering machine with 15 minutes recording time and 2 announcement texts is integrated into the main unit of the EuroPhone XL.
- The system has a 40 memory alphanumeric telephone directory.

Call transfer, intercom call, call forwarding, 3 party conference and a host of other telephone system features are all available as standard on the EuroPhone XL.
